

ENVIRONMENT

One of four 'physical/functional' domains concerning biological function and physical wellbeing.

The environment is the surroundings in which an animal lives and operates. So providing a safe and comfortable home for animals is very important. A horse's environment can also affect how it's feeling (its mental wellbeing). Providing the right environment can make a horse feel safe, comfortable and happy. A change in the environment may make a horse feel too hot/cold and uncomfortable.

Good environment

Plenty of space

Free from hazards

Access to shelter
(natural and/or manmade)

Poor environment

Restricted/
cramped

Little ventilation

So many hazards!

Unsuitable
conditions

Here at Redwings...

We want our residents to live as naturally as possible so most live outside 24/7. Others may be in stables for training or vet care but we do all we can to make it as comfortable as possible e.g ventilation. heat lamps in ICU.
